(54) METHOD AND APPARATUS FOR SIMULTANEOUS REMOVAL OF NITROGEN AND PHOSPHORUS

(57)Abstract:

PURPOSE: To efficiently perform the simultaneous removal of nitrogen and phosphorus with stable removal capacity, in the treatment using an anaerobic-aerobic activated sludge method, by dipping sulfide ore in an anaerobic tank and introducing a carbon source into the anaerobic tank along with inflow water.

CONSTITUTION: After a carbon source such as NaHCO_3 or CaCO_3 is introduced into an anaerobic tank 11 along with inflow water, the introduced water is reacted with the sulfide ore such as FeS_2 or FeS received in the anaerobic tank 11 and water containing the sulfur and iron components eluted from the sulfide ore is introduced into a denitrification tank 12 to bring about sulfur denitrification reaction. Thereafter, the water flowing out of the denitrification tank 12 is allowed to flow in an aerobic tank 13 to be nitrified by nitrifying bacterial and a part thereof is returned to the denitrification tank 12 while the outflow water from the aerobic tank 13 is introduced into a sedimentation tank 14 and supernatant water is discharged as treated water. As mentioned above, by filling the anaerobic tank with the sulfide ore, denitrification speed can be increased and the sulfur component eluted from the sulfide ore is oxidized and the rising of a DO value is prevented to keep an anaerobic atmosphere being a necessary condition generating the discharge of phosphorus.
